

A satellite map of a wetland area, likely a coastal plain or delta, showing a complex network of water channels and land. The land is a mix of brown and green, indicating different vegetation or soil types. Numerous small, colored dots (yellow, orange, green, blue) are scattered across the map, representing data points or sampling locations. The dots are most concentrated in the upper left and center-right areas.

# Wetlands and Climate Change: Bridging the gaps in science and on-the-ground adaptation

**IPCC 2001:** “regional inventories & management plans for wetlands at greatest risk from climate change”

**IPCC 2007:** “integrated large spatial-scale remote sensing with long-term field studies” of wetlands

# Wetlands Adaptation Group

Pacific Northwest Wetlands Symposium

November 8, 2012  
Woodland Park Zoo, Seattle, WA

2 years →

**5th Annual Pacific Northwest  
Climate Science Conference**

**September 9-10, 2014**

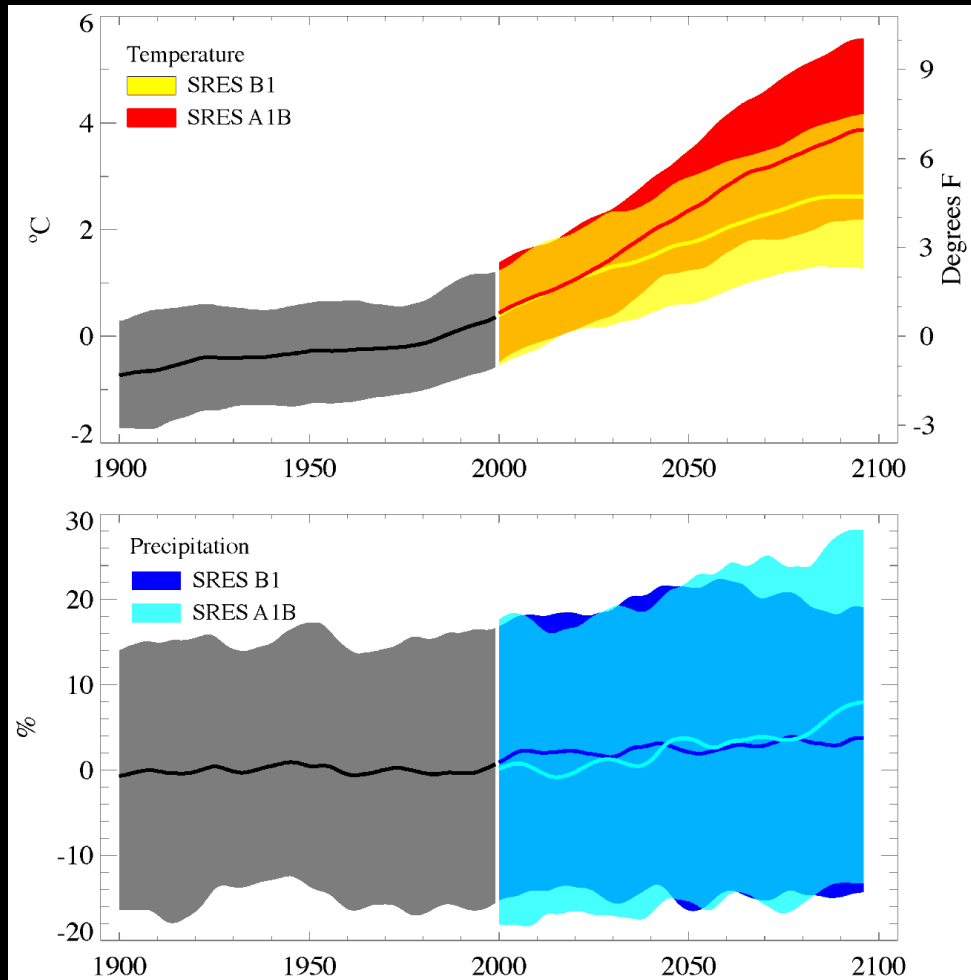

Today's session:  
What we've learned so far  
Current applications  
Your input on next steps

# Key findings

- Promising new approaches & products
  - Mapping wetlands
  - Reconstructing historical hydrologic data
  - Modeling historical variability & climate impacts
- Continuing challenges
  - Data limitations & methodological hurdles
  - Wetland diversity! (awesome, and a challenge)
  - The “loading dock problem”

# PNW Climate Model Consensus

**Strong Warming** in all  
Seasons, Especially  
Summer

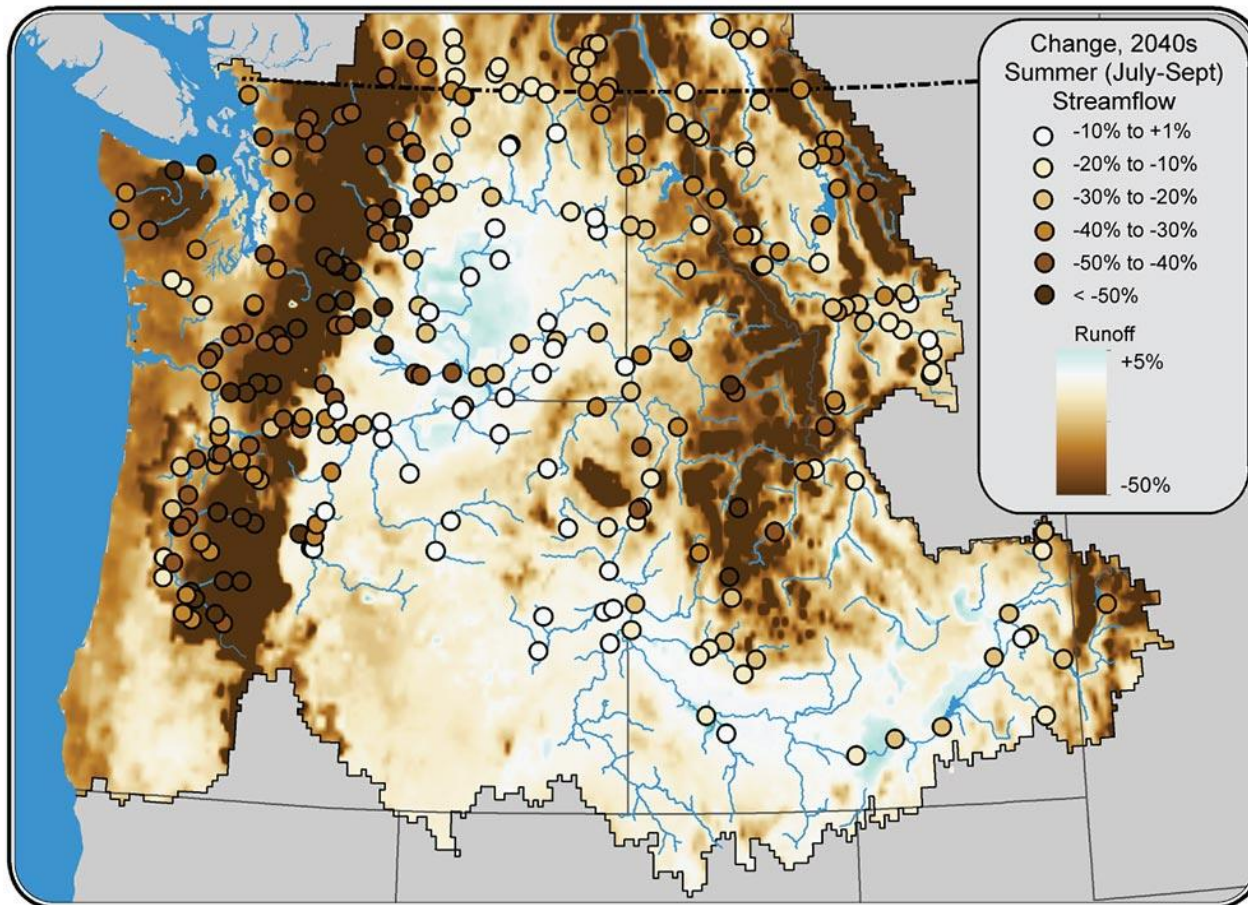

Relatively **Small Changes**  
in Annual **Precipitation**

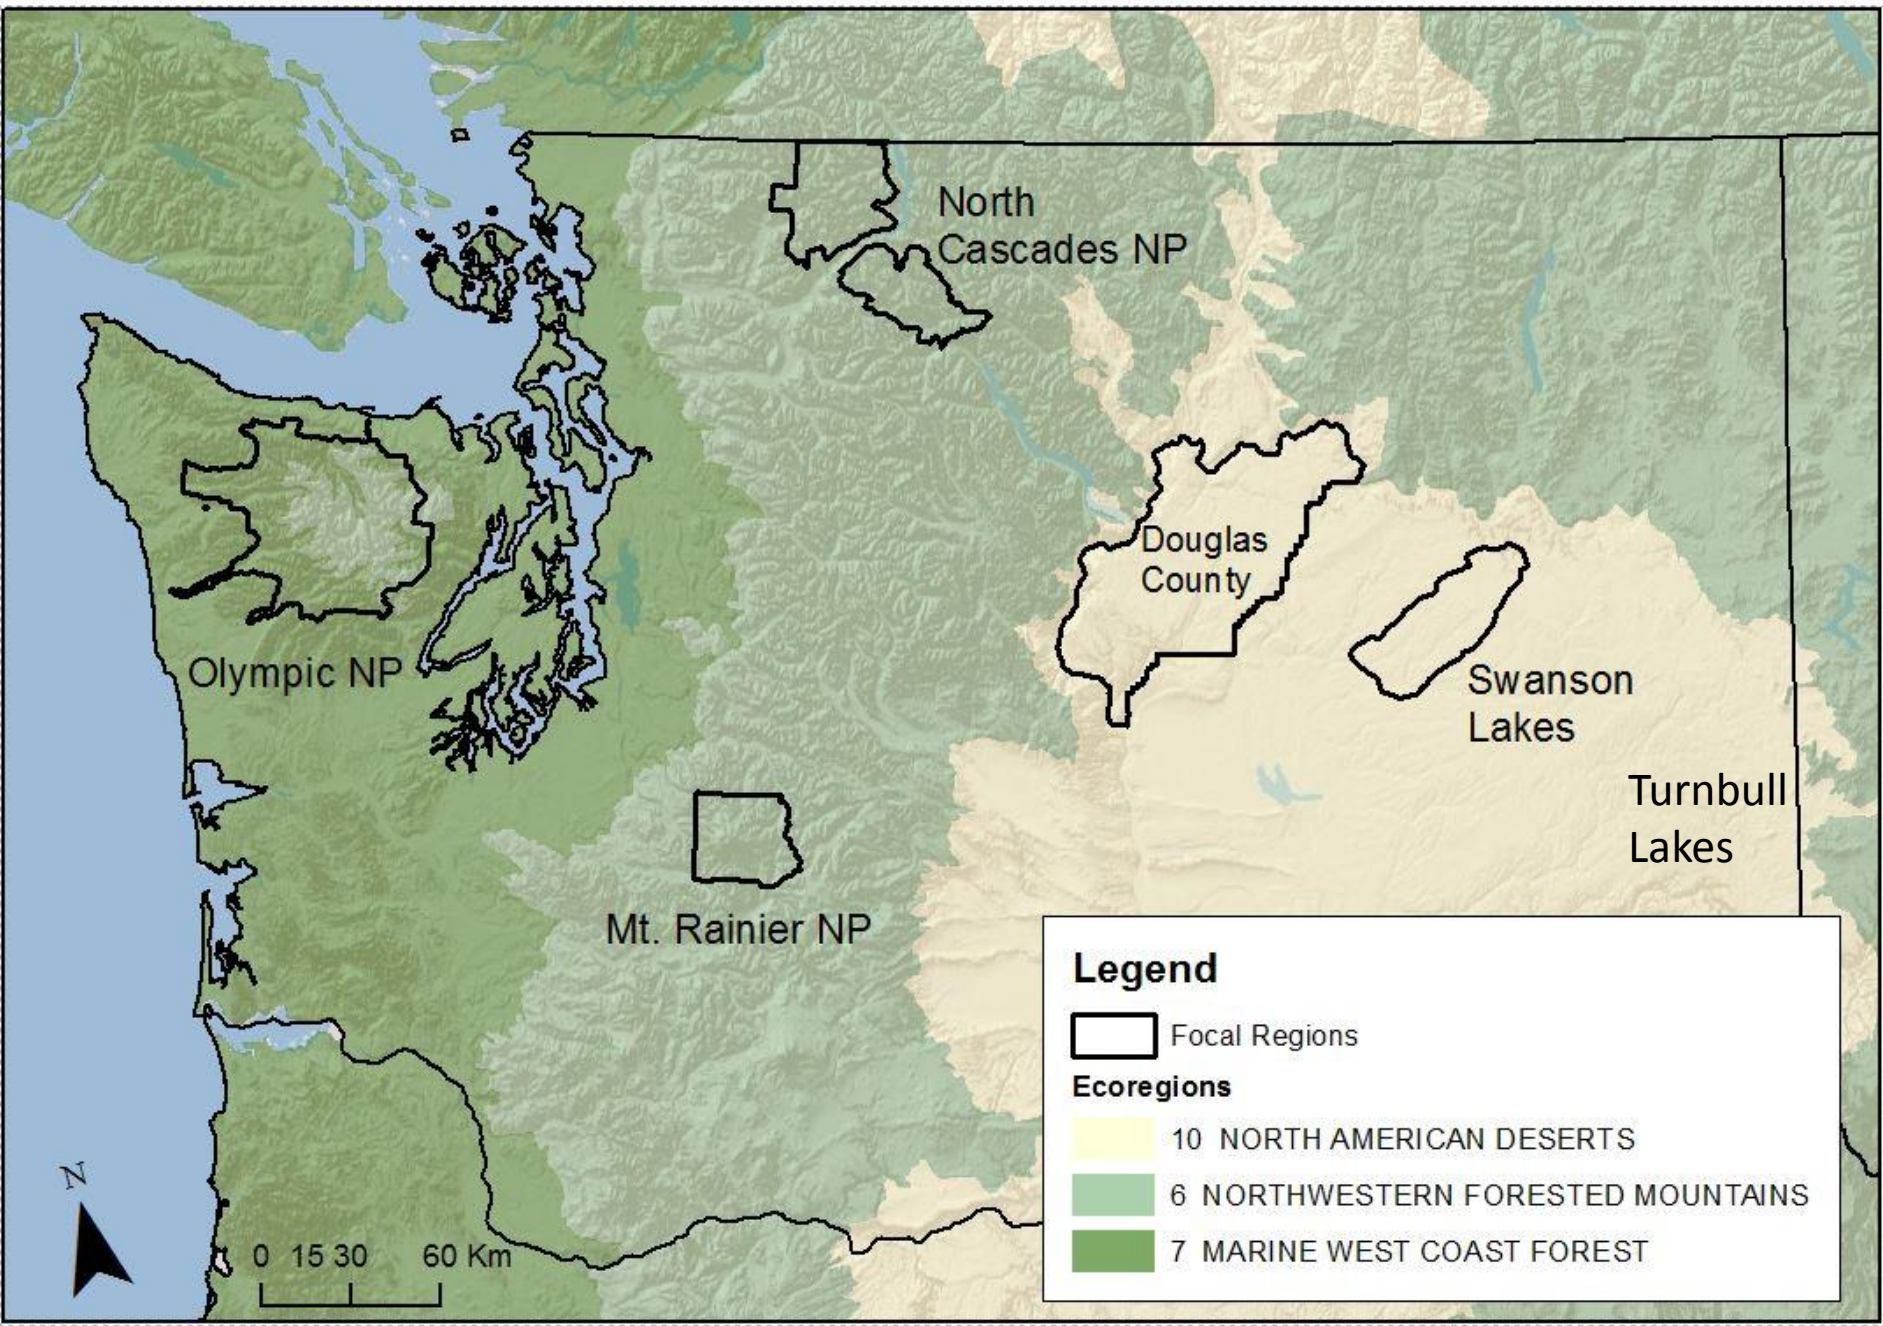

**Wetter Falls, Winters, &  
Springs**

**Drier Summers**

## Reduced Summer Flows

# Wetlands & Climate Change: Research & Conservation Challenges we seek to address

### Challenge #1:

We often don't know where wetlands are, and many old maps are wrong or incomplete.

### Challenge #2:

Wetlands are naturally very dynamic & sensitive to climate change.

### Challenge #3:

Diverse, understudied, limited baseline data.

### Challenge #4:

Limited ability manage in general, and especially in the face of climate change.

*National Wildlife Refuge | Washington*

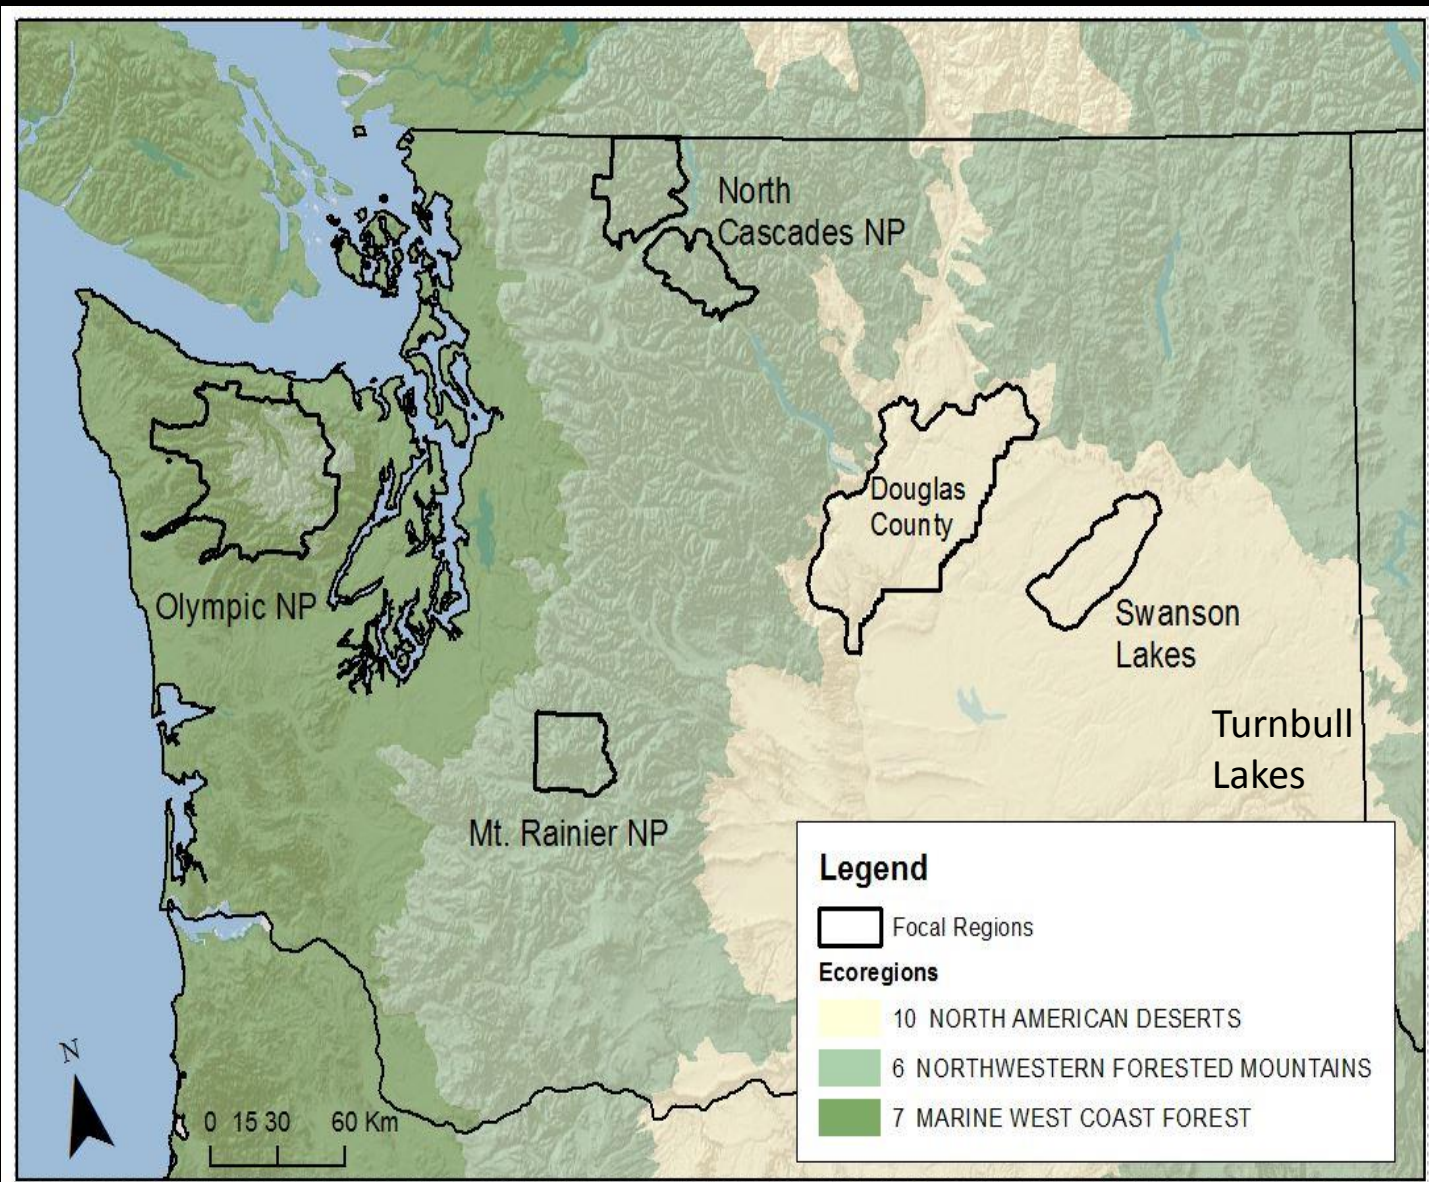

# Remote Sensing Tools to Map Wetland Hydrology

# Issues:

- Existing datasets are insufficient:
  - National Wetland Inventory
  - field data
- Existing remote sensing techniques for wetlands are inadequate
  - Temporal resolution is limited
  - Spatial resolution is too coarse

# Pattern recognition tools & 3D mapping (LiDAR)

Courtesy of UC Berkeley Remote Sensing Lab

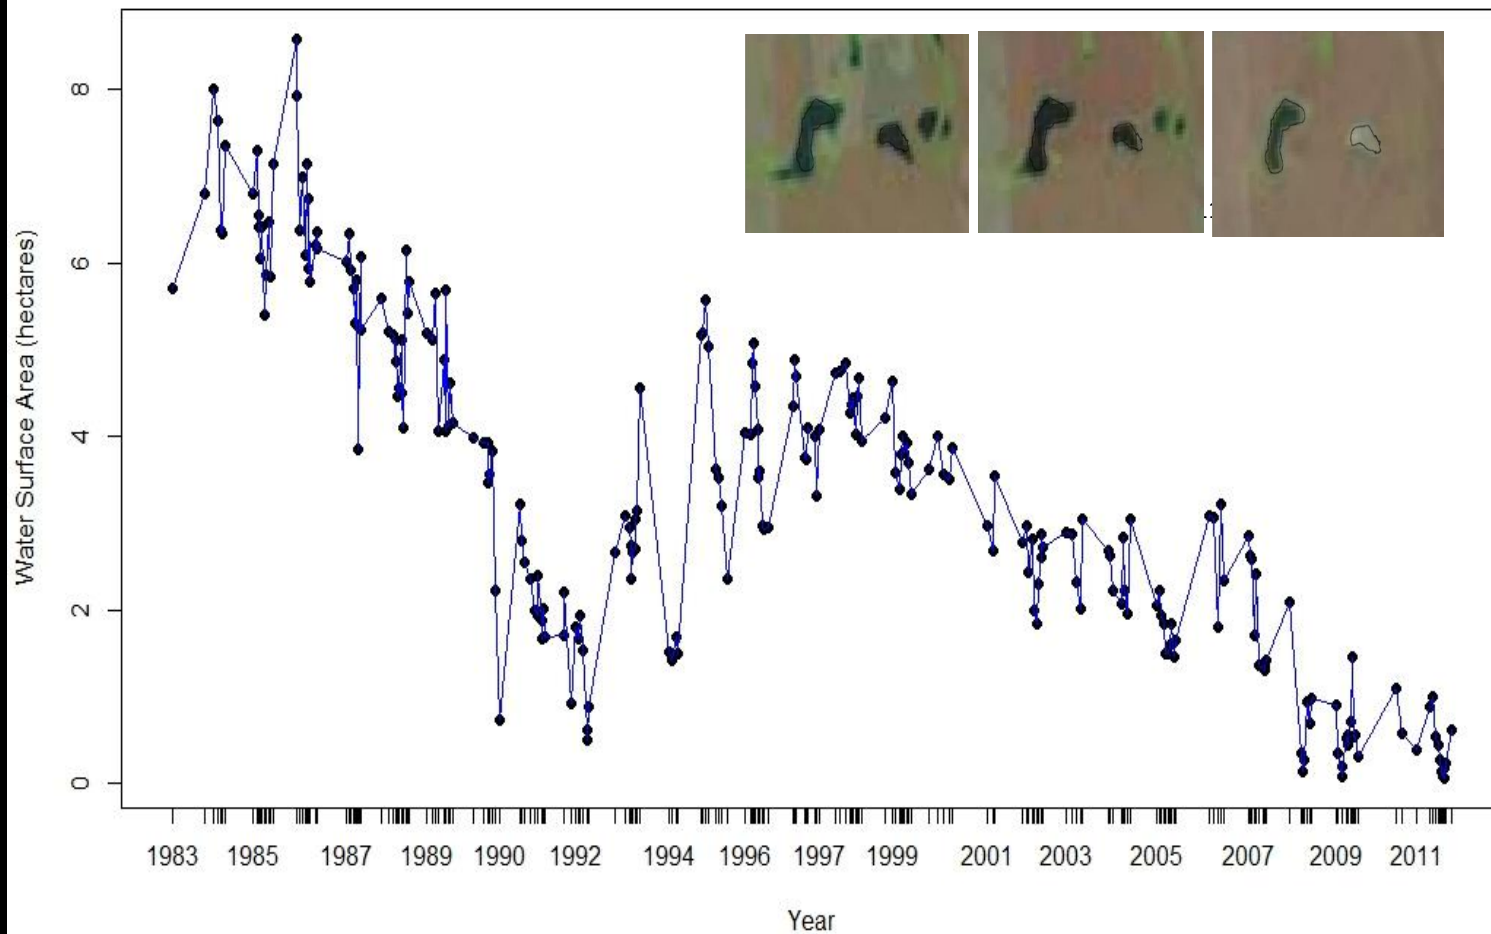

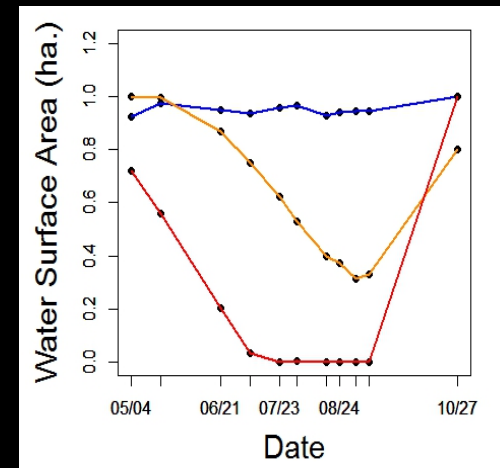

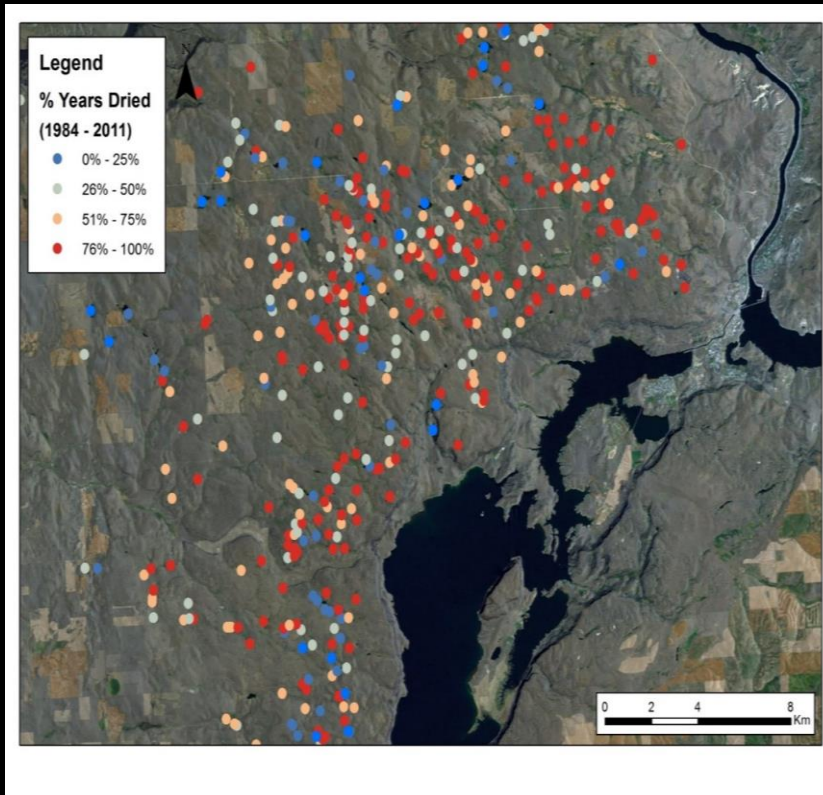

# Combining datasets together to increase spatial and temporal data

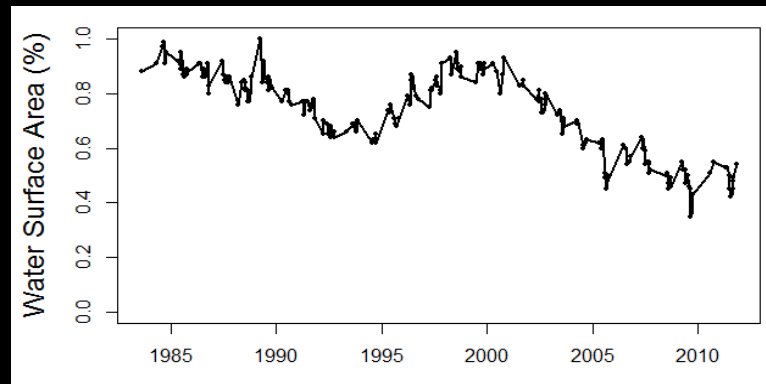

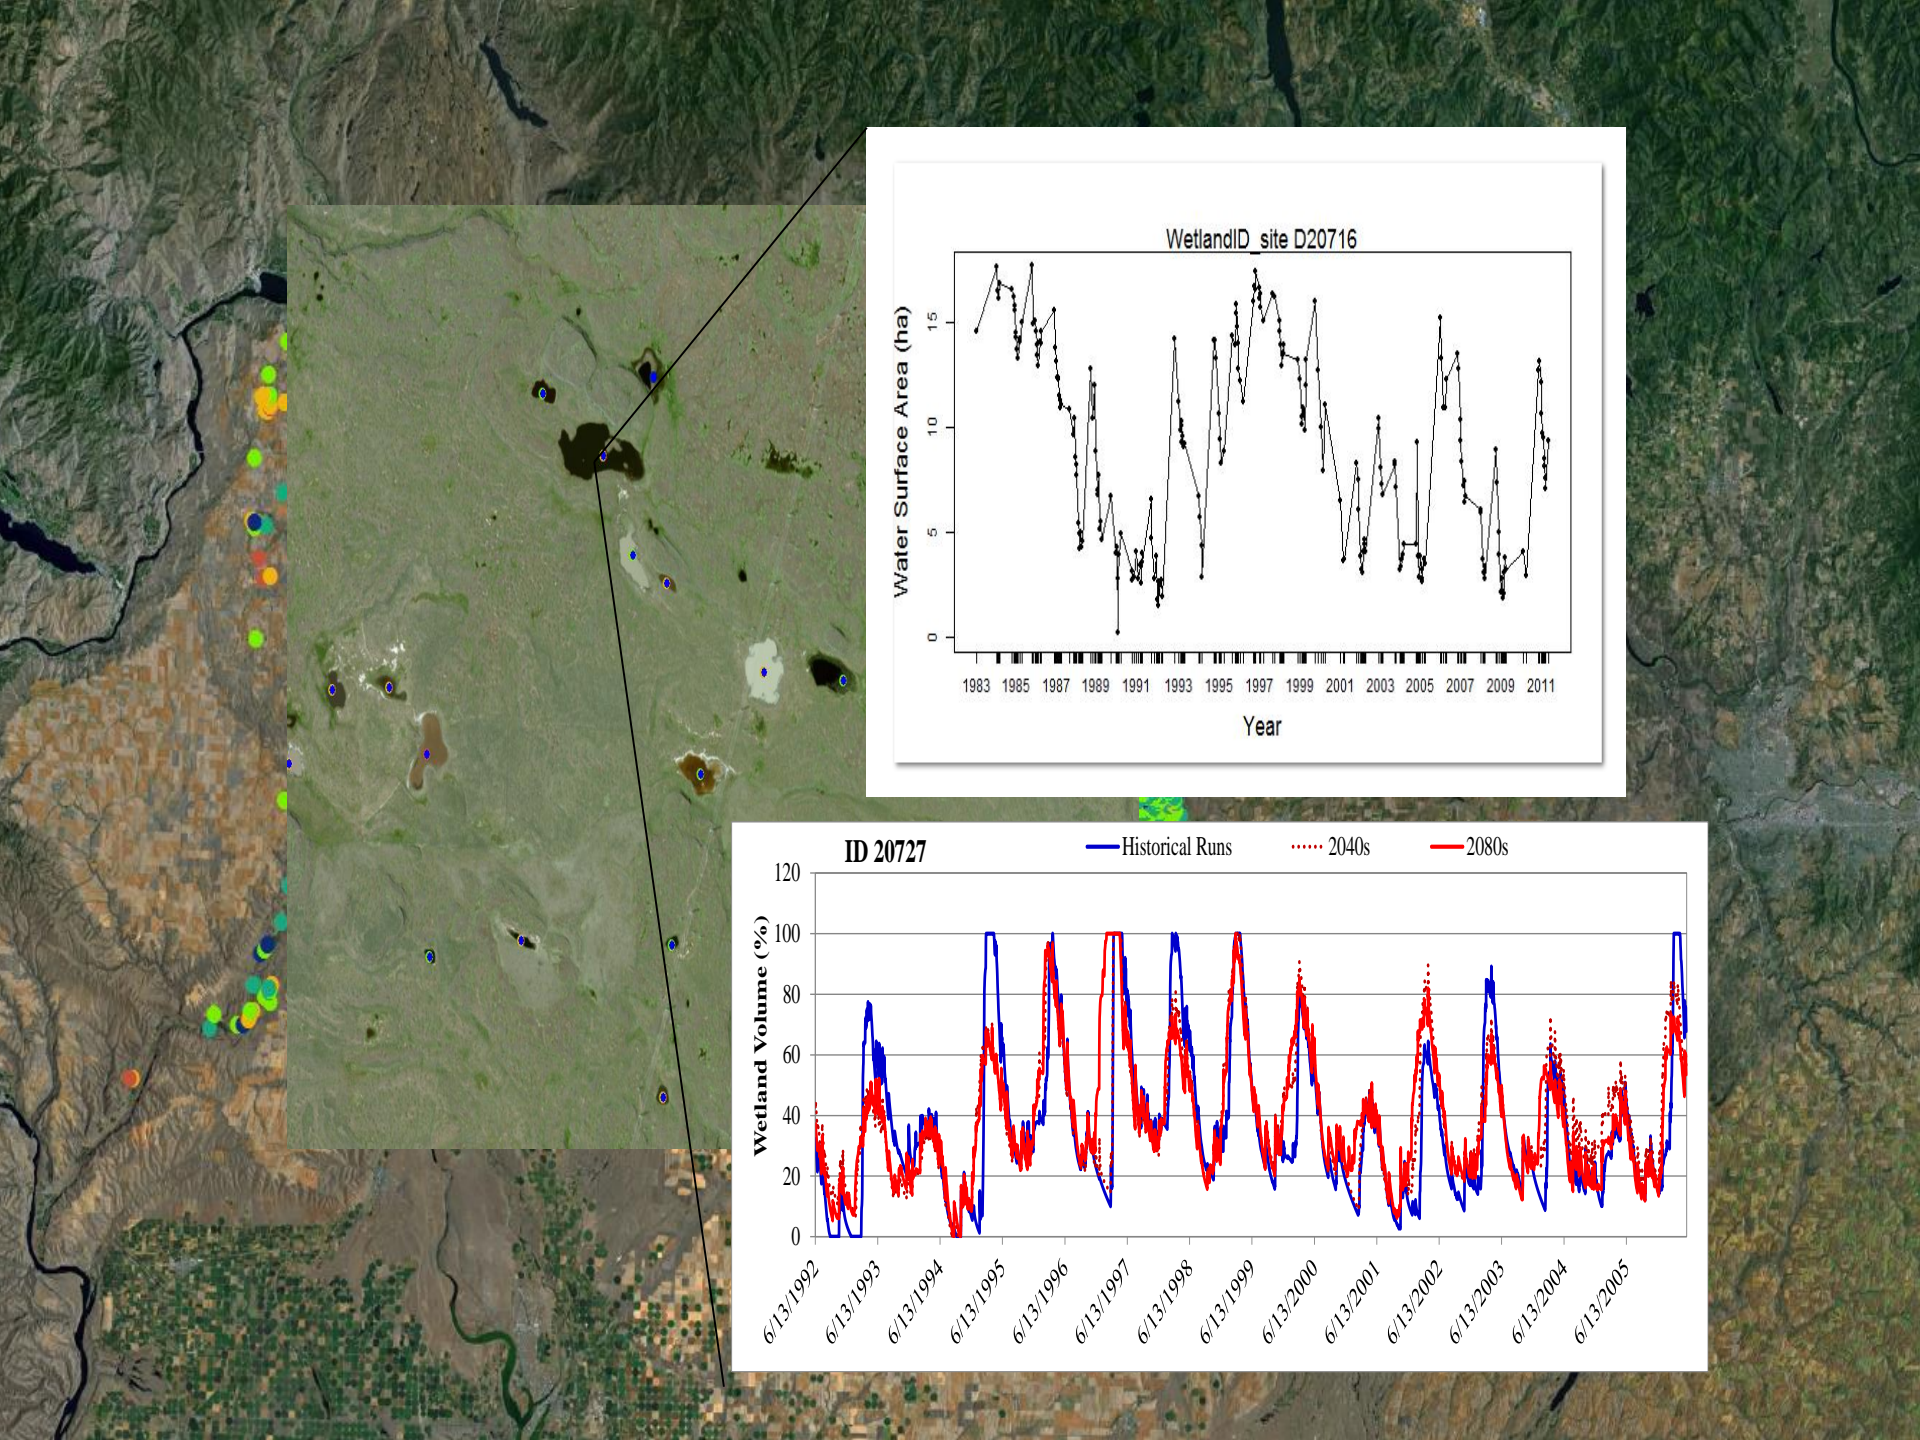

## 5th Annual Pacific Northwest Climate Science Conference

September 9-10, 2014

Smith Fellows

General Challenge:

Linking solid & creative research with  
tangible applications on the ground.

(the “loading dock problem”)

What are our **options for conservation action\***?

- Would you use our products?
- What are your wetlands management priorities?
- Do you have data or the capacity to collect data on historical or current hydrology?
- We need your input.
