# West Coast Salmon Climate Vulnerability Assessment

**Lisa Crozier<sup>1</sup>, Michelle McClure<sup>1</sup>,  
Melissa Haltuch<sup>1</sup>, Elliot Hazen<sup>2</sup>,  
Steven Bograd<sup>2</sup>, Mark Nelson<sup>3</sup>**

Climate Team Meeting  
January 2017

<sup>1</sup>Northwest Fisheries Science Center, NMFS  
<sup>2</sup>Southwest Fisheries Science Center, NMFS  
<sup>3</sup>Office of Sustainable Fisheries, NMFS

# Fish Stock Climate Vulnerability Assessments

**Goal: Assess the vulnerability of all NMFS-managed fish and invertebrate species to changing climate/ocean conditions to help inform science and management actions.**

# Process

- Develop methodology
  - attributes, scoring bins, logic rules
- Literature review for each species : **Species Profile**
- Expert scoring
  - Preliminary scores online
  - Scoring workshop
- Analysis
- Species narratives
- Manuscripts
  - methodology, results CVA/Salmon

# Fisheries Stock Climate Vulnerability Assessments

## Species Vulnerability

### Sensitivity

- Habitat Specificity
- Prey Specificity
- Sensitivity to Ocean Acidification
- Sensitivity to Temperature
- Stock Size/Status
- Other Stressors
- Adult Mobility
- Spawning Cycle
- Complexity in Reproductive Strategy
- Early Life History Survival and Settlement Requirements
- Population Growth Rate
- Dispersal of Early Life Stages

### Exposure

- Sea surface temperature\*
- Air temperature\*
- Salinity\*
- Ocean acidification (pH)\*
- Precipitation\*
- Currents\*\*
- Sea level rise\*\*

*\*modelled results (mean & variance)*

*\*\*written description only*

# Salmon Vulnerability Assessment

- 1) Recovery domains and Distinct Population Segments (DPS)
- 2) New sensitivity and exposure attributes
- 3) Results – patterns in vulnerability
- 4) Conclusions and implications

# Salmon Recovery Domains – 29 ESA-Listed DPS

Added 4 unlisted DPS

Pink (1)

Chum (3)

Sockeye (2)

Coho (5)

Chinook (11, all domains)

Steelhead (11, all domains)

# **Salmon-specific Sensitivity Attributes**

**Life-stages – habitat specific**

**Population resiliency/Adaptive capacity**

**Specific Threats**

# Salmon-specific Sensitivity Attributes

## Life-stages – habitat specific

Egg

Juvenile: freshwater, estuary, marine

Adult

## Population Population resiliency/Adaptive capacity

Viable salmon population criteria

## Threats

Cumulative life cycle effects

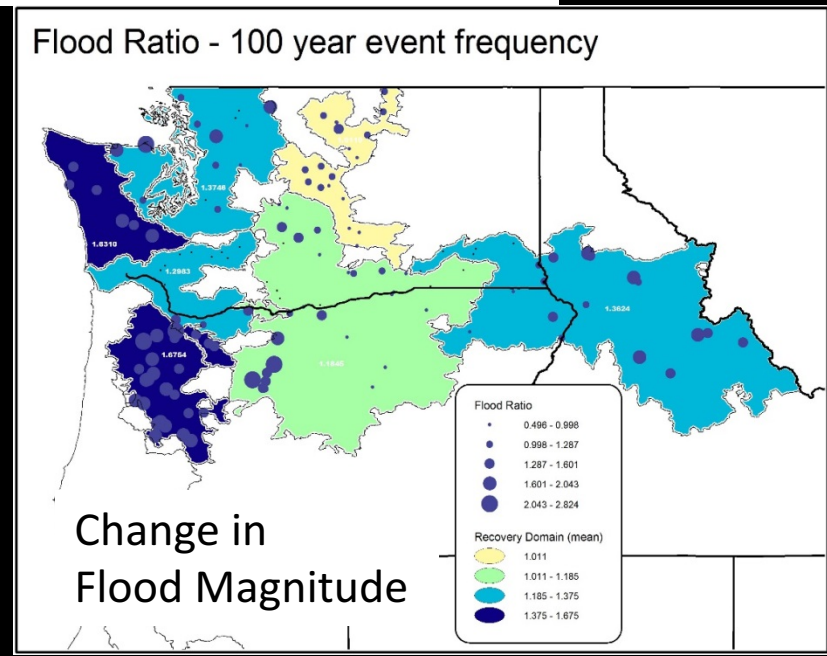

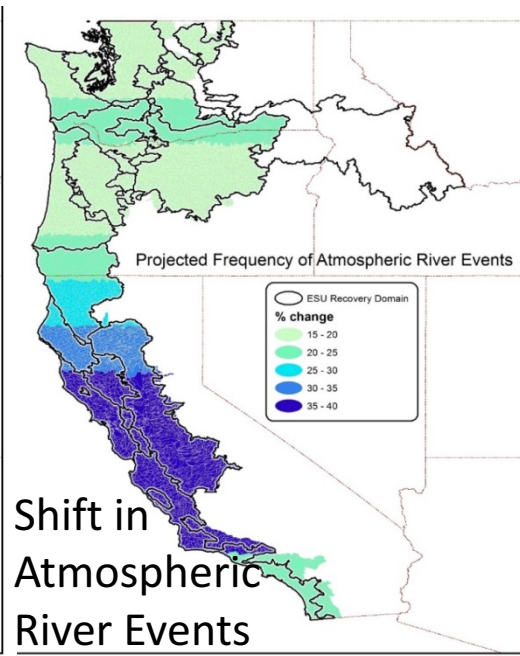

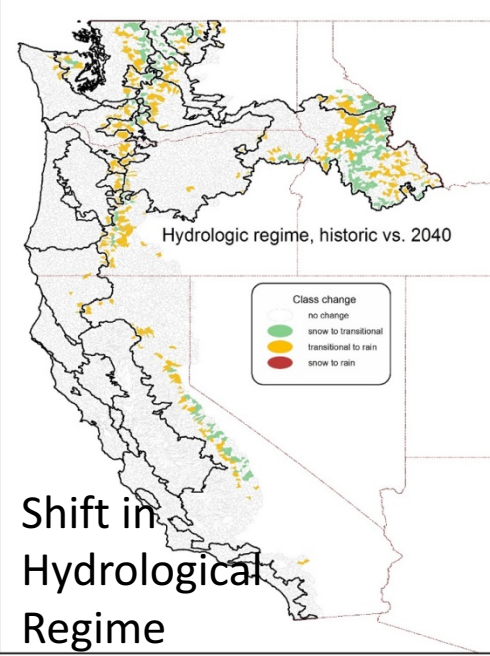

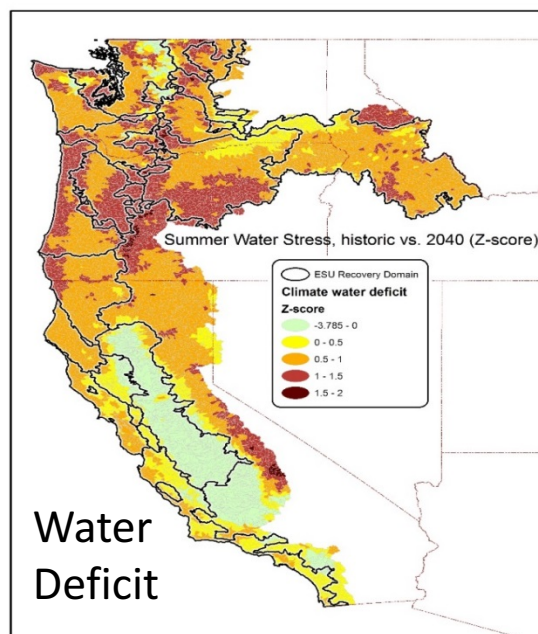

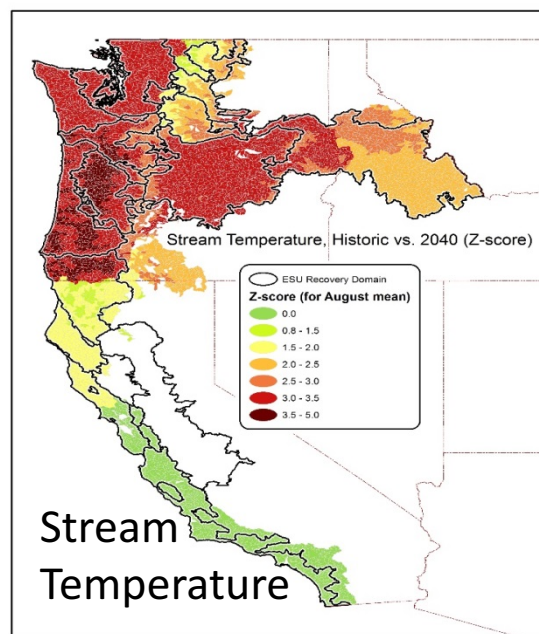

Hatchery impact

Other Stressors

Ocean acidification

# Freshwater exposure factors

# Data quality

Adequate data

Limited data

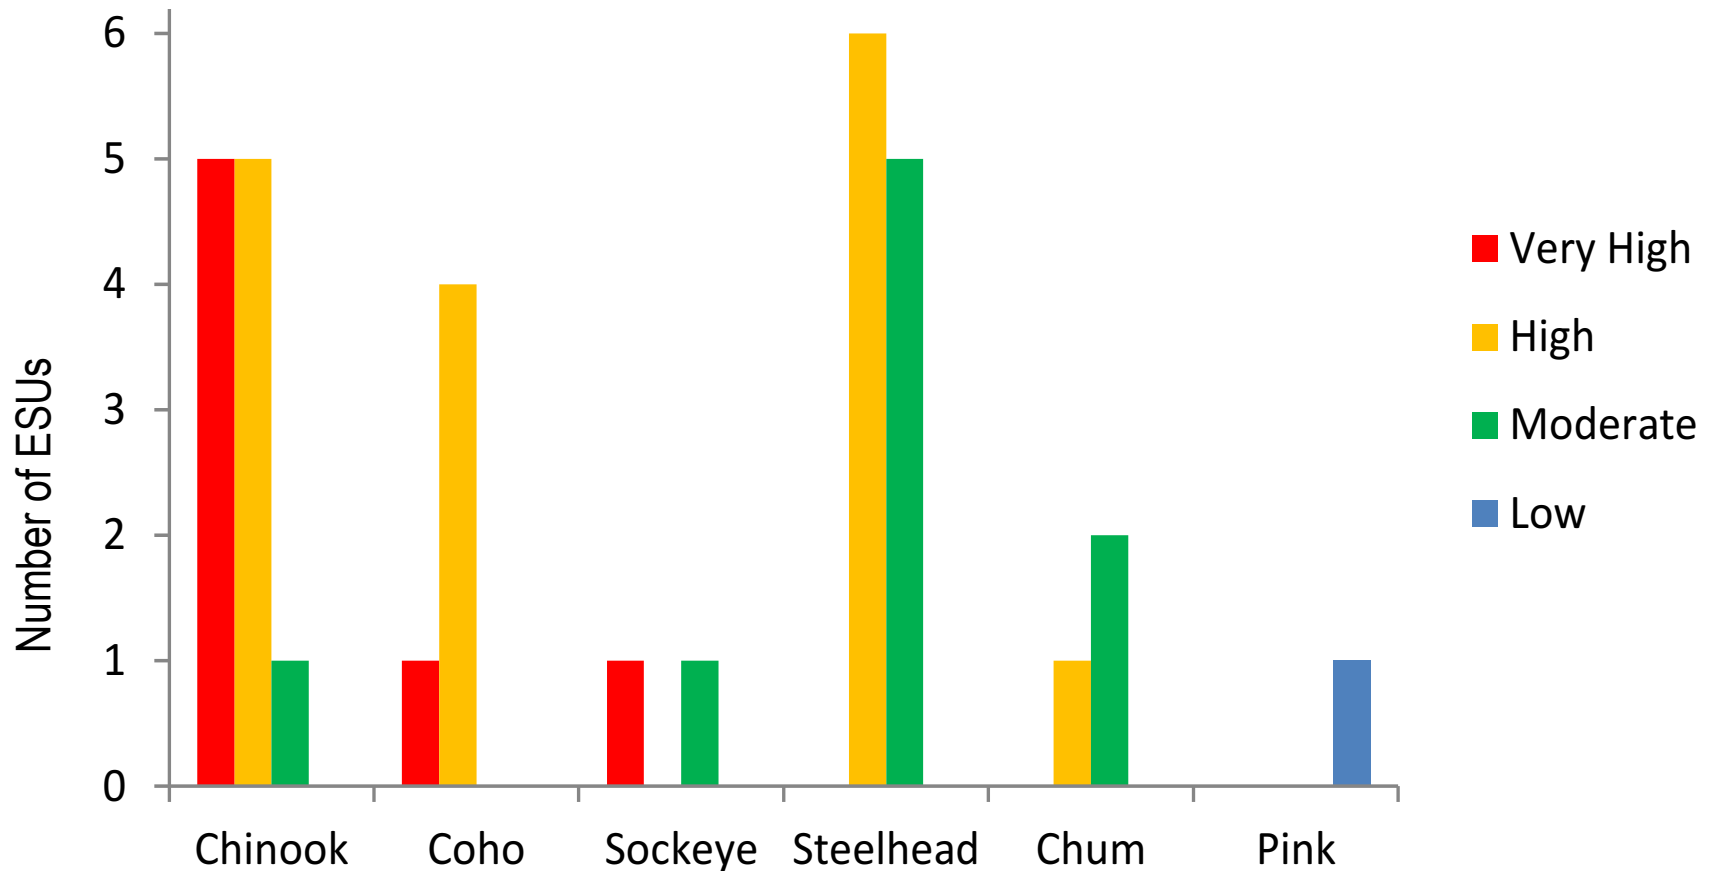

Expert judgment

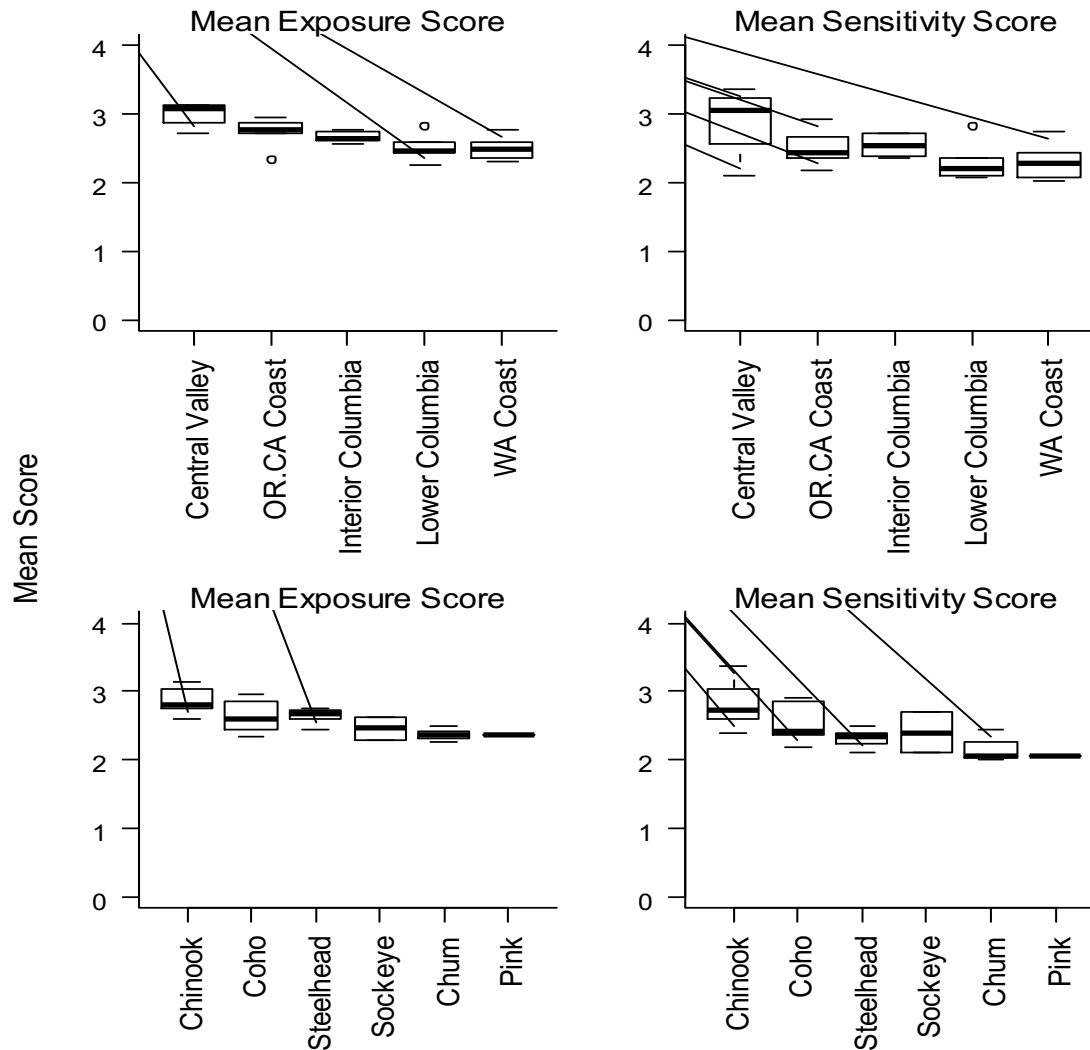

# Results I: Final Vulnerability Ranking

		Exposure			
		Low	Moderate	High	Very High
Sensitivity	Very High			Sacramento River winter-run Chinook Central Valley spring-run Chinook Central Valley fall-run/late fall-run Chinook Central California Coast Coho Upper Willamette River spring-run Chinook Snake River Sockeye	Central Valley Chinook Southern coho Spring Chinook Interior sockeye
	High			<i>Southern Oregon/Northern California Coast Coho</i> <i>Mid Columbia Spring Chinook</i> <i>Upper Columbia River spring-run Chinook</i> California Coastal Chinook Puget Sound Chinook Snake River Basin Steelhead Southern California Coast Steelhead Middle Columbia River Steelhead Upper Columbia River Steelhead Puget Sound Coho Puget Sound Steelhead Snake River fall-run Chinook Hood Canal Summer-run Chum Upper Willamette River Steelhead Lower Columbia River Coho Oregon Coast Coho	Snake River spring/summer-run Chinook
	Moderate		Puget Sound Chum Columbia River Chum	<i>Central California Coast Steelhead</i> <i>South Central California Coast Steelhead</i> Northern California Coast Steelhead California Central Valley Steelhead Lower Columbia River Steelhead Lower Columbia River Chinook Lake Ozette Sockeye	
	Low		Puget Sound Pink		

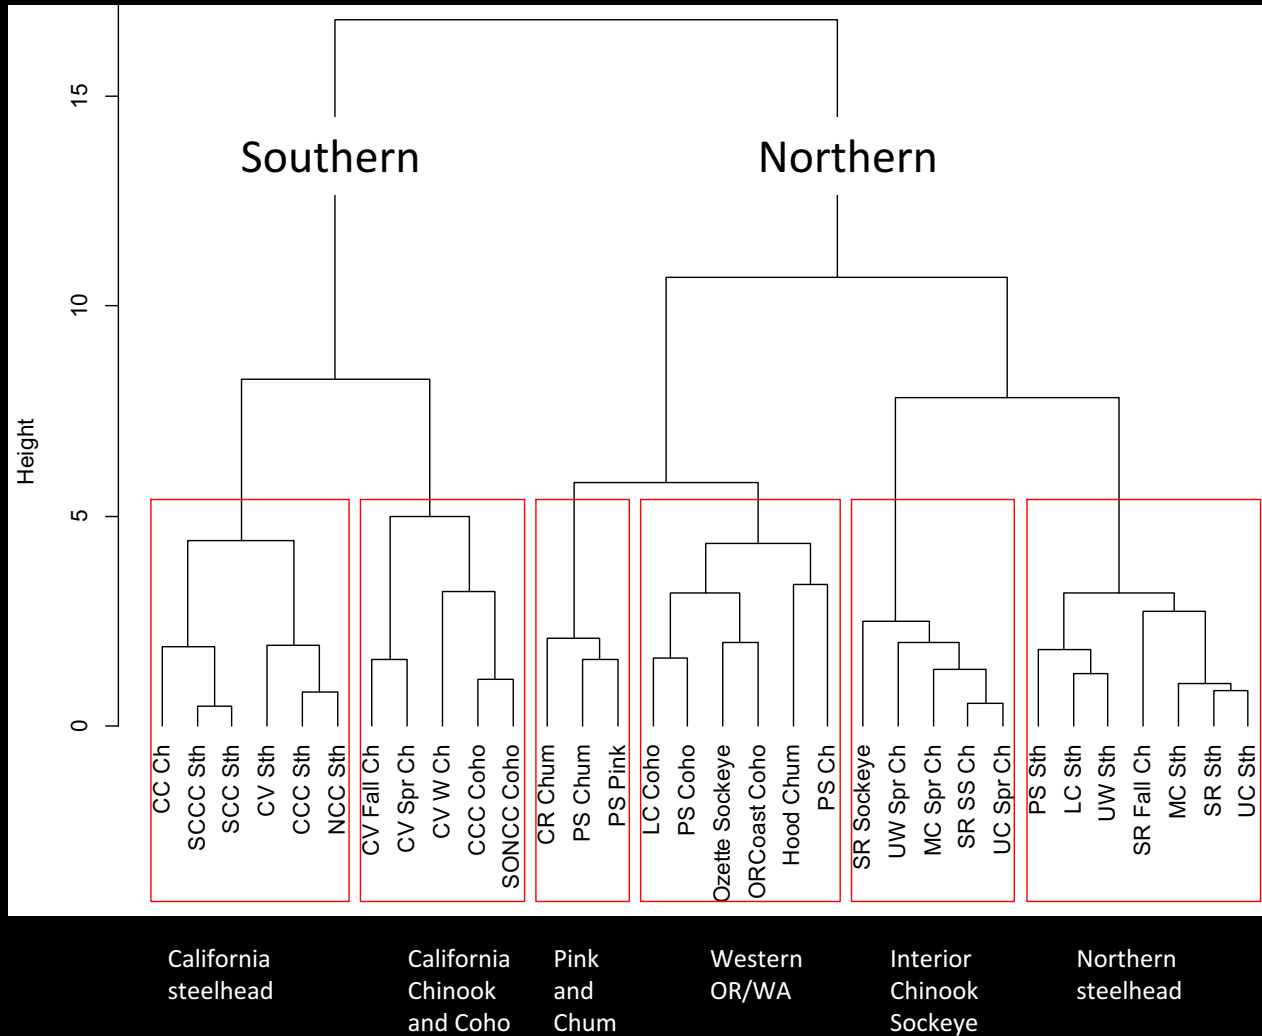

# Spread of ESUs within each species

# Mean component score by recovery domain and species

# Cluster analysis of all attributes

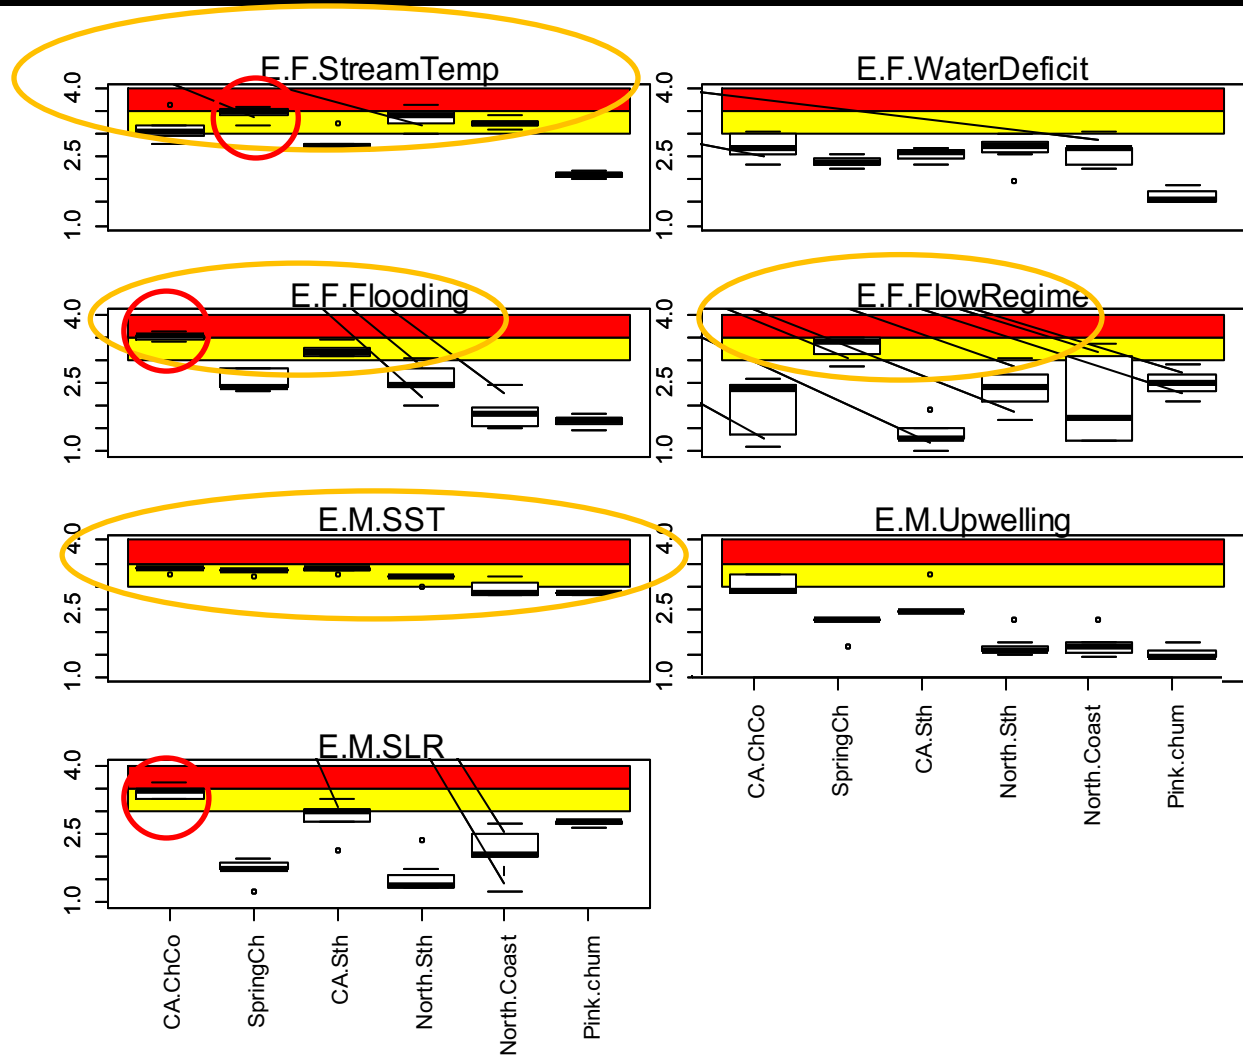

# Exposure Scores

OA exposure very high for all ESUs  
In addition:

Very High if  
2 attributes  $\geq 3.5$   
Snake River Spr/Su Ch  
Stream Temp, Regime

High if  
1 attribute  $\geq 3$   
Stream Temp, Flooding

# Sensitivity scores

Very High if  
3 attributes  $\geq 3.5$

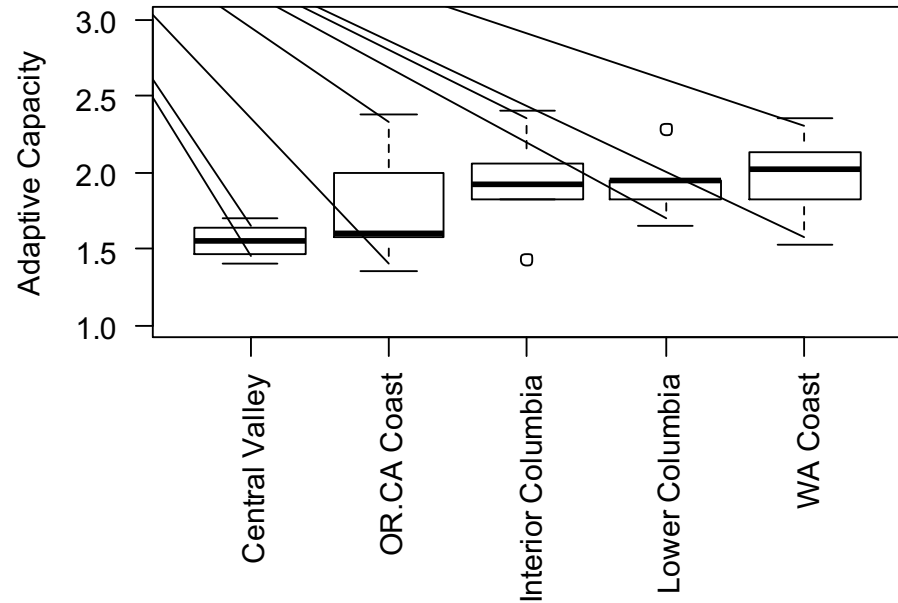

High if  
2 attributes  $\geq 3$

# Likelihood of behavioral change

By recovery domain  
North > South

By species

# Hotspots: High sensitivity and high exposure in the same life stage

	<b>Adult</b>	<b>Juvenile</b>	<b>Egg</b>	<b>Estuary</b>	<b>Marine</b>
<i>Exposure:</i>	<i>Stream Temperature</i>	<i>Regime Shift/Tstream (*both)</i>	<i>Flooding</i>	<i>Sea Level Rise</i>	<i>Upwelling</i>
	Snake River spring/summer-run Chinook	Snake River spring/summer-run Chinook*	Sacramento River winter-run Chinook	Central Valley fall-run/late fall-run Chinook	Central Valley fall-run/late fall-run Chinook
	Mid Columbia Spring Chinook	Mid Columbia Spring Chinook*		Central Valley spring-run Chinook	
	Snake River Sockeye	Upper Columbia River spring-run Chinook		Sacramento River winter-run Chinook	
	Upper Willamette River spring-run Chinook	Southern Oregon/Northern California Coast Coho			
<i>Key:</i>	Interior Columbia			Central Valley	

# Other products: Species Score Sheet

California Central Valley Steelhead – *Oncorhynchus mykiss*

Sacramento River winter-run Chinook – *Oncorhynchus tshawytscha*

# Other products: Species Narrative

- Central California Coast Steelhead, *Oncorhynchus mykiss*
- Overall Climate Vulnerability Rank: Moderate(65% Mod, 35% High in bootstrap analysis)
- Climate Exposure: Moderate. Four exposure factors contributed to this score: Ocean Surface Temperature (3.4), Sea Level Rise (3.0), Flooding (3.1), and Ocean Acidification (4.0).
- Biological Sensitivity: Low . None of 10 sensitivity attributes scored above 3.0 but on the border were current population viability (2.9), Estuary stage (2.9), NS other stressors (3.0). CCC steelhead are listed as a threatened species and are extremely sensitive to degradation of and/or changes to streams and estuaries where they spend the 1-3 years of life but are probably less sensitive to long-term changes in ocean conditions. They presumably have some buffering from resident rainbow trout populations in headwaters, which can produce individuals that go out to sea.

# Conclusions

Rarest life histories at greatest risk

Winter-run, late-fall run, spring-run

Southern range limits at high risk

Climate-vulnerable life histories

Less adaptive capacity

Highest exposure

Anthropogenic impacts limit climate resilience

Water quantity and quality

# Management implications

- Recovery Plans and Biological Opinions
  - Prioritize actions by climate risk
  - Restoration decision tools (Beechie et al 2013)
- Fishery/Hydropower Management
  - Limit Columbia River and marine fisheries during climate stress
  - Hydropower planning for higher temperatures
- Research
  - Prioritize quantification of climate impacts
    - (e.g., life cycle models)
  - Targeted research on mechanistic links with marine survival and OA sensitivity
    - Ecosystem modeling with climate impacts

## WHY

Growing demands and requirements for climate-related information.

## GOAL

Increase the production, delivery, and use of climate-related information to support agency and stakeholder decisions.

## Western Regional Action Plan

Conforms to the national framework, identifies strengths, weaknesses, priorities, and actions to implement the Strategy on the West Coast over the next 3-5 years

  - What attributes most affected final ranks?
  - Correlations
  - Knowledge gaps
- Conclusions

# Salmon Vulnerability Assessment

## Objectives:

1. Provide relative vulnerability rankings across species (**triage**)
2. Identify key attributes/factors driving vulnerability
3. Identify key data gaps or information needs
